1.0 Introduction

This report revisits the theme of residential segregation on Northern Ireland Housing Executive Estates outside Belfast District – as defined before the revision of council areas in 2014. This subject continues to be important as the Housing Executive remains a major provider of social housing across Northern Ireland and residential segregation (and its reverse, residential mixing) are still a focus of central government concern through programmes such as Together Building a United Community (TBUC) and an issue in prospect for the next Programme for Government.

The questions posed by residential segregation are given a greater edge by the demographic changes experienced in Northern Ireland between 2001 and 2011. These have seen levels of residential segregation, as measured by statistical indicators, decrease. This decade also saw the continued ageing of the population and the rise of immigrant communities, with people from outside Ireland or Britain in a few concentrated areas. These factors all suggest that further consideration of the demographic context of Housing Executive estates – as well as more widely – is timely and necessary, both to provide a benchmark and also to indicate what remains unknown and what population questions require further investigation.

This report accordingly starts by considering the context for residential segregation between 2001 and 2011 for Northern Ireland in general and also the twenty-six local government districts that provide a consistent basis for comparison between 2001 and 2011. It then discusses the data and method used. Following this, the report provides summary statistics on residential segregation in Housing Executive estates across Northern Ireland. It then concludes by surveying what is known, as well as highlighting what remains poorly understood. The report itself is kept brief, but detailed statistics by estate by district council (Appendix 1)provide empirical support for observations made in the text.

2.0 Data and methods

Since the Housing Executive does not collect religion/community background information on its residents, the best available approach is to use grid-square data from the Census of Population as described by Shuttleworth and Lloyd (2007) to estimate estate populations by overlaying grid-square data with Housing Executive estate boundaries. This analysis used 100m counts, as these units can capture variations at a small spatial scale and they are also more likely to make better estimates of the individual characteristics of Housing Executive tenants in any given place.

The Northern Ireland Grid Square Product, drawn from the Northern Ireland Census, facilitates the analysis of residential segregation at a small spatial scale on housing estates by providing data for very small spatial units. Unique to Northern Ireland, this resource provides univariate counts for a wide variety of Census variables for 1971, 1981, 1991, 2001 and 2011, for 1 km cells and 100m cells for all Northern Ireland in 2001 and 2011, and for selected urban areas in earlier years. Full counts are not available for all variables for all areas. For 1971-2001, where cells contained less than eight households or 25 individuals, religion and community background counts, for instance, are suppressed to preserve confidentiality and only the total population and household counts are given. In 2011, the threshold was raised to 30 usual residents in 10 households.

The housing estate boundaries were provided by the Housing Executive. These referenced all properties owned (or previously owned) by the Housing Executive and had already been captured in GIS format as XY point coordinates. Estate codes and estate names were attached to each address point and the estate polygons were digitised based on these characteristics.

The process that was adopted to link 100m cells to Housing Executive estates was to allocate a 100m cell to an estate *if its centroid fell within the boundary of that estate*. For practical purposes, this method of matching the 100m data to Housing Executive estate boundaries was likely to be sufficient, but there may be a small minority of cases where

population from a 100m cell was not allocated to an estate because its centroid lay outside the estate boundaries despite a substantial part of the cell lying within the estate. The findings should therefore be taken as showing *overall patterns, trends, and structures*. Also, because of the differing disclosure threshold in 2011 as compared with 1971-2001, it is not possible to compare 'like with like'. However, experience of similar exercises suggests that these problems tend to cancel each other out and that the spatial linkage procedure is adequate for purpose.

There could also be some estates for which there was no intersection with a 100m cell. The Housing Executive defined 425 estates outside Belfast. Census data with religion/community background information was obtained for 369 of these estates in 2011. This subset is therefore used for analysis.

At this stage it is worthwhile to make some general comments about the descriptive statistics that are presented later:

- the percentages calculated and presented on religion in later tables in the body of the report and in the appendices use the whole population as the base;
- for 2001, data from the community background question is used, and for 2011 the
 equivalent religion or religion brought up in question. No attempt is made to
 attribute the nones and not stateds to either group and to some extent this is
 already done by census methodologies in deriving these variables.
- in the calculation of the *D* segregation index, Catholics have been compared with Protestants.

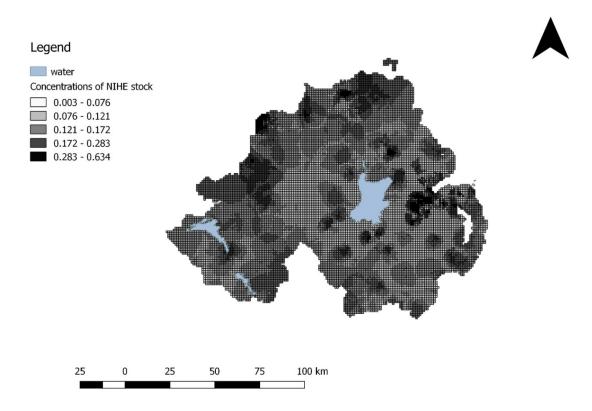

There were several reasons for no further action being taken on our part. Prime among these was that the data reported by the Census from these questions represents the way that people report their own identity or that it is estimated using official methodologies. Other statistical methods can be used to allocate individuals to one group or the other but these methods can always be challenged so it is simpler to use the data as provided.

Finally, population and household totals in 2001 (and to a lesser extent 1991) do not match the sum of individuals by religion or households across tenure types. This is because of the process of small cell adjustment (for reasons of confidentiality) in which small counts are modified so they are not disclosive. This means that population and household totals vary between Census tables as well as not always being internally consistent. To avoid grand totals being inconsistent with internal summations, grand totals have therefore been replaced by sum totals where necessary. Moreover, in 2011, slightly different procedures were used for the release of the grid-square data: the threshold was changed upwards to 30 usual residents in 10 households. This will also impact on comparisons across years. The main focus therefore should be on trends and general patterns rather than specific figures.

3.0 Results

3.1 Setting the scene

Map 1 shows the distribution of social housing stock across Northern Ireland in 2011 using 1km census grid-square data. The concentration of this stock in Belfast is obvious but there are also substantial proportions in Derry, Mid Ulster and, to a lesser extent, in towns throughout Northern Ireland, though involvement is slight in areas such as Moyle. Changes in estates across Northern Ireland will be shaped by changing overall and local levels of residential segregation and so it is to this general theme that the discussion now turns.

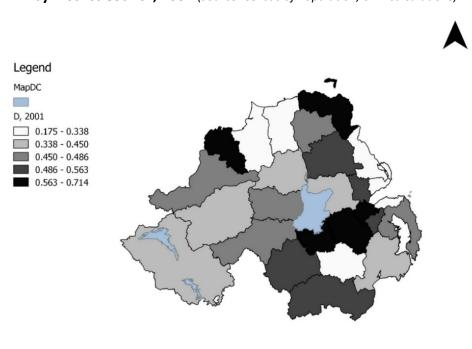

Map 1: Concentrations of Housing Executive stock (Source: Census of Population, own calculations)

Evidence has accumulated since the release of the results of the 2011 Census that residential segregation, as measured by statistical indicators, has decreased since 2001. One index commonly used is the *D* Index (Lloyd et al 2014). This index measures the extent to which populations are unevenly distributed between the units used to release population

statistics. D takes a value between 0 and 1, where a larger value implies a higher degree of segregation.

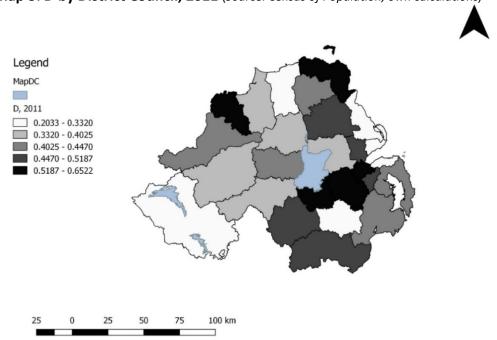

The overall level of *D* fell from 0.60 to 0.56 between 2001 and 2011 when calculated for wards; from 0.65 to 0.61 using 1km grid squares, and from 0.74 to 0.64 using 100m grid squares. The trend is clearly downwards, albeit from and to different levels which reflect the impact of the size of the underlying statistical units: bigger units (e.g. wards) tend to be more internally variable than smaller units (e.g. 100m grid cells) and so there is less scope for unevenness between them. The analysis is taken a step further by looking at *D* for wards nested within District Councils. This is not a completely satisfactory approach, since it does not account for the population neighbourhoods of wards near the edge of district councils, but it does give some insights into how far residential segregation varies across Northern Ireland. This information is presented in Maps 2 and 3. There is a marked consistency between 2001 and 2011 figures in the higher levels of unevenness in Belfast, Derry and Mid Ulster and relatively low levels in areas such as North Down and Fermanagh.

100 km

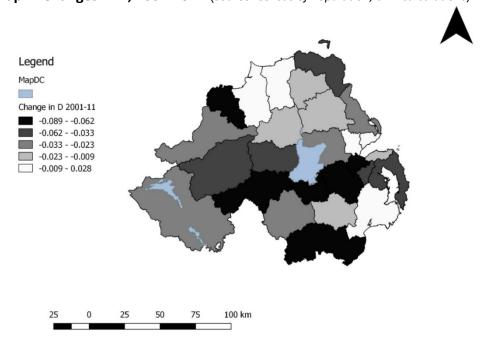

75

Map 2: D by District Council, 2001 (Source: Census of Population, own calculations)

Map 3: D by District Council, 2011 (Source: Census of Population, own calculations)

Map 4 shows that over the decade to 2011, *D* fell across all council areas, but especially so in those places where it was high in 2001. The context, therefore, is declining segregation from a peak in 1991 and 2001 across Housing Executive stock and this can be seen in general descriptive statistics for Housing Executive estates.

Map 4: Changes in D, 2001-2011 (Source: Census of Population, own calculations)

3.2 Population distributions 2001-11 across Housing Executive estates

The analysis begins by comparing the distribution of estates by community background decile – in other words, the counts of estates that are 0%-9% Catholic, 10%-19% Catholic and so on – in Figures 1 and 2.

■ 2001 6 7 5 6

Figure 1: Percentage distribution of estates outside Belfast 2001 and 2011, by decile (percentage Catholic)

Source: Census of Population, own calculation

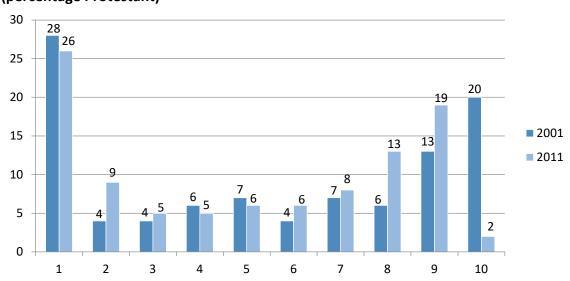

Figure 2: Percentage distribution of estates outside Belfast 2001 and 2011 by decile (percentage Protestant)

Figure 1 shows the distribution of estates by percentage of residents who described themselves as Catholic in 2001 and 2011. Figure 2 shows the equivalent figures for the distribution of estates according to the proportion of residents who described themselves as Protestant. They indicate that the distribution of estates by community background remained polarised in 2011, but that there had been major changes at the highly-Protestant end of the distribution, with a sharp fall in the estates that were 90% or more Protestant but a rise in the share of those in the 70%-90% classes. This suggests that estates that were "very Protestant" in 2001 remained "very Protestant" in 2011, but just not with such a preponderance as ten years before. This is confirmed by Table 1, which looks at the distribution of people and households in areas that fall above or below set thresholds (80% or more Catholic, 80% or more Protestant; 20% or less Protestant, 20% or less Catholic).

Table 1: Population concentrations on Housing Executive estates by religion – community background 2001, and religion brought up in 2011

		20	01		2011				
	Nι	ımber		%		ımber	%		
	People	House-	People	House-	People House-		People	House-	
		holds		holds		holds		holds

More than 80%	74,344	32,900	41.79	46.05	46,637	21,118	29.23	30.84	
Protestant									
Less than 20% Catholic	80,327	35,530	45.15	49.73	72,899	32,833	45.70	47.96	
Less than 20% Protestant	61,344	21,249	34.48	29.74	53,061	20,943	33.26	30.59	

Source: Census of Population, own calculation

The results in the table are not exactly symmetrical because they do not take account of people who do not declare as either Protestant or Catholic. They indicate, confirming the picture shown in Figures 1 and 2, that the share of households and people in areas that were more than 80% Catholic remained steady between 2001 and 2011 but that, over the same period, the share of households and people in estates that were 80% or more Protestant fell. As in Belfast, it seems that there has been Protestant decline.

However, this conclusion is qualified by the remainder of Table 1 and by Table 2. The proportion of people and households in estates less than 20% Catholic continued at a steady level between 2001 and 2011 (see Table 1) and there was a relatively high share in 2011 of

people with no religion in highly-Protestant estates (see Table 2). These findings imply that part of the proportional decline of the population in highly-Protestant estates can be attributed to an increasing number of people who declared themselves to have *no religion* in 2011, by comparison with the number who described themselves as 'Protestant' in 2001. However, it is unknown how far this explains all the changes that have been observed.

Table 2: Population concentrations on Housing Executive estates (2011)

Religion b	rought up in	Profile of Estate							
			80% or more	20% or less	20% or less				
		Catholic	Protestant	Catholic	Protestant				
	Catholic	46,842	2,676	5,477	48,489				
Number of	Protestant	3,000	39,251	59,099	3,338				
residents	Others	208	488	763	240				
	None	841	4,222	7,560	994				
	Catholic %	92.04	5.74	7.51	91.38				
Dorcontago	Protestant %	5.89	84.16	81.07	6.29				
Percentage	Others %	0.41	1.05	1.05	0.45				
	None %	1.65	9.05	10.37	1.87				

Table 3 continues the analysis by reporting segregation levels and the community background composition of Housing Executive estates across the 26 District Councils that formerly provided the framework for local government in Northern Ireland. The first two columns report *D* for 2001 and 2011. These results suggest that Housing Executive estates became *less segregated* over the decade in most district councils; although there were some exceptions where segregation increased, the numeric preponderance of council areas where there were decreases would lead to a general fall in segregation across all the estates. In some areas like Coleraine and Ards, segregation levels remained low in 2011 as in 2001 and were less than the Northern Ireland average, but in others such as Cookstown, Derry and Dungannon, levels were higher than the 2011 Northern Ireland global *D* score (0.64) for 100m grid squares. This suggests that there are very different challenges in different areas of Northern Ireland. In some council areas like Dungannon, for instance, population blocks of equal size are distributed highly unevenly across Housing Executive

estates, and thus *D* is relatively high. In other areas, such as North Down, a small minority population is evenly distributed, and *D* is relatively low.

Table 3: D and religious composition across Housing Executive estates by district council, 2001 and 2011

Source: Census of Population, own calculations

The remaining columns in Table 3 report the community background composition of Housing Executive estates in each district council in 2001 and 2011. This shows that the story is not so much one of *Catholic increase* – proportionally in most cases the 2011 Catholic share is close to that in 2001 – but one of *Protestant decline*, especially in those

council areas in the East of Northern Ireland with large Protestant majorities in 2001. Good examples of this are North Down and Carrickfergus, where Catholic proportions remained constant but Protestant shares fell, presumably because fewer people declared themselves as such in 2001 than in 2011. It is probable that an increase in *nones* in 2011 who were Protestants in 2001 explains a large part of the decrease in segregation and the apparent decline in the Protestant population.

Appendix 1 presents information on individual estates in 2011 by district council. There is a vast amount of information but two headline observations can be made. First, the population with nationalities other than those found in Ireland and Britain (i.e. those likely to be immigrants) was unevenly distributed by district council and by estate within each council area. This is likely to be a reflection of patterns of labour demand across Northern Ireland, and local housing structures and opportunities. Second, relatively high shares of nones were found in estates with high Protestant shares, but not in every case – it is by no means an iron rule. However, it appears that there was a greater chance of higher shares of nones in the east of Northern Ireland. This implies that there are local variations in changing religious affiliations and identities.

4.0 Conclusion

The analysis suggests that Housing Executive estates outside Belfast have undergone some of the same demographic changes as the Belfast estates and, indeed, the population of Northern Ireland. Noteworthy has been a decrease in residential segregation, when Catholics are compared to Protestants, in some council areas that were highly-segregated in 2001 and the growth of other nationalities in some estates, especially in Mid Ulster where there is a strong immigrant labour market presence.

Also noteworthy is the decline in Protestant proportions in estates that were very Protestant in 2001. This is not general but is mainly in the east and often concentrated in a few estates. These observations raise a number of questions about the factors that underlie the 2001-11 decrease in residential segregation. The demographic process noted in Belfast, whereby Protestant decreases were often in areas with relatively large numbers of other nationalities, does not seem to apply widely outside Belfast, with these communities being located in Catholic as well as Protestant estates. Rather it seems that comparatively high numbers of 'nones' are located in Protestant areas. This might have the effect of reducing Protestants proportionally and absolutely, although more work is needed on population dynamics to investigate this more thoroughly.

Given the concentration of 'nones' in some estates in some areas, intriguing questions about identity, geography and spatial context are also raised. They include considerations about the mechanisms by which residential segregation has declined, and how far this decline is meaningful in social terms, since the largest demographic changes have been in estates and areas that were mainly (and dominantly) Protestant in 2001 and it is assumed that these have mainly driven changes in population concentrations and thus indices such as *D*.

These questions cannot be answered using the grid-square data alone. Nevertheless, it is safe to conclude that some Housing Executive stock remains highly segregated – in some council areas – but that in others segregation is low. Furthermore, the best evidence we have is that spatial unevenness of Catholics and Protestants across the Housing Executive stock – but also more widely – decreased between 2001 and 2011; more attention needs to

be given to *how* and *why* this has happened, and to its socio-political meaning. Moreover, it seems that different demographic processes have happened in Belfast as compared with council areas beyond the city, and that council areas themselves are highly diverse and followed different trajectories in the decade between 2001 and 2011.
